NORMAL ACTIVITY

Threshold: 50% Probability

Evidence & Reasoning

Why Seizure?

The model identified 8 segments with high-frequency variance and rhythmic patterns matching ictal EEG signatures.

Temporal Profile:

Seizure activity occurred primarily between 1732.0s and 2348.0s.

Top Biomarkers:

C3-P3, P4-O2, P7-O1, F3-C3, F4-C4

Diagnostic Indicator:

No sustained seizure activity detected within the analyzed window.
